

AWS IAM Identity Center Migration by AWS Support Team

The following are some examples from AWS on how to deal with the migration.

1. **old_idc_report** extracts the assignments (user/group - account - permset) and the permission sets from the old IdC
2. **idc_create_permset** creates the permission sets in the new IdC with the same names as in the old one and generates a list with the new permsets and their ids
3. **SAML** federation is set up
4. **SCIM** provision is configured and run
5. **new_idc_report** extracts users and groups new ids
6. **idc_remap** creates the assignments taking into account the new users/groups ids and the new permsets ids
